

Quoted: know what to charge brands

Oct 7, 2026 · @shalap

1. Summary

Quoted helps micro-creators in India price brand deals, counter low offers and track every rupee, so their income stops depending on guesswork.

- **Problem.** Brands and agencies are building pricing tools on deal data, while most small creators still quote by gut feel or follower count.
- **Product.** An AI price check built on reach, not followers, that shows its math and says when it is unsure; a drafted counter-offer; and a board of every deal.
- **Value metric.** Money left on the table: the rupees between what a creator accepts and the bottom of a fair range.

2. The problem: creators price blind while brands price with data

Brand money is flowing to small creators, who negotiate it with the least information. About 45% of brand influencer spend will go to creators under 20,000 followers, up from 19.5% in 2021, per eMarketer figures reported by [Campaign](#). India's market is estimated at ₹4,500 to 5,000 crore for 2026 by [Kofluence](#), a platform vendor, and at ₹3,375 crore by [EY and Big Bang Social](#), so read the size as a range.

Pain point	Evidence	What it costs the creator
No benchmark	A 2017 Internet Creators Guild survey of 100 creators found brand-mention rates from 0.2 to 50 cents per view, with terms often confidential. It is dated and YouTube-focused.	A first quote is a guess, and low guesses get accepted.

Pain point	Evidence	What it costs the creator
The other side has data	Billion Dollar Boy prices from \$173M of past quotes and final deals, and 45% of marketers and procurement staff say their organisation has mispriced creator fees.	Brands know what deals clear at. Creators do not.
Quoting on followers	EY found brands weigh engagement rate and audience quality.	Thin reach is over-priced and strong reach under-priced.
One shot at a fixed fee	71% of brands pay a fixed fee (EY, 2024), and 29% of ICG respondents reported payment problems.	The first number is the deal.

This product picks the first problem: pricing and negotiating the offers that already arrive. A single message costs a creator money there, the loss is measurable per deal, and AI can do real work. Content ideas and captions lead creator AI use at 64.4% per Koflucose, and pricing and negotiation are not on its list. Growth tooling is the next phase. One caution: EY names audience and credibility, not pricing, as creators' top challenges, so assumption A1 in section 7 tests whether pricing pain is strong enough to pay for.

3. Who it is for: a creator with offers and a creator without

Two personas share one product. Shalap is where the prototype starts, because offers already arrive and the value is measurable on every deal.

	Shalap	Pandotra
Who	24, literature creator on Instagram (28.4k) and YouTube (9.2k), with one or two inbound brand offers a month	21, student in Indore, thrift and styling reels on Instagram (6.8k), with no offers yet
Pricing today	Quotes by gut feel, or accepts the first number the brand names	Does not know what to ask, and fears an unpaid 'exposure' deal

	Shalap	Pandotra
Wants and fears	A fair price and the words to reply. Fears countering and being ghosted	A first paid collaboration. Fears undercharging or looking unprofessional
Quoted gives	Price check, offer verdict, counter draft, deal board	Price check from her best posts, outreach drafts and a shareable rate card (phase 2)
Success	Closes at or above the bottom of the range and replies the same day	A first paid deal within 60 days

Pandotra is the larger group: [Kofluence](#) reports that 61.1% of India's active creators are nano creators (1,000 to 10,000 followers). Journey maps for both are in the design pages.

4. The product: check the price, counter, log the result

Quoted turns each offer into a priced, defensible and tracked deal: check the price, counter if it is low, book, log the final price, and let closed deals recalibrate the range. The loop is drawn in the design pages.

Pain point	Feature	Status
No benchmark	Price a deal (AI): a low, mid and high range from reach on each platform, with confidence, the math and watch-outs	Built
Low first offers	Offer verdict and opening ask, then Draft reply (AI) that counters at one price	Built
Lumpy, untracked income	Deals board (New offer, Negotiating, Booked, Paid), and a Home that shows what is on the table	Built
Disclosure risk	A paid-partnership reminder on every result, because ASCI requires a label for any material connection	Built

Pain point	Feature	Status
Typing stats every time, and no offers yet	Connected accounts, outreach drafts (AI) and a shareable rate card	Phase 2
Price drifts as reach grows	Reel price card that moves with stats, and calibration from closed deals	Phase 3 (card built)

What makes the AI different from a calculator:

- **It prices on reach.** Expected views times a rate band (an assumed ₹250 to 900 per 1,000 views), adjusted for usage rights, exclusivity, engagement and niche.
- **It admits doubt.** It states confidence with a reason, asks the creator to confirm numbers that look wrong, and never invents market data.
- **It is wrapped in code.** Missing stats, implausible view counts and the offer verdict are checked deterministically. The 10 evals and 5 guardrails are in Part B.

5. Value: money left on the table, measured on every deal

Quoted's value is the rupees a creator would otherwise leave on the table, and it is measured on every deal.

- **Left on the table**, for one deal, is the bottom of the fair range minus the price accepted, never below zero.
- **The north-star metric** is the median left on the table per deal. Its companion is **rupees recovered**: the final price minus the brand's first offer, on deals where a counter was sent.

Worked example, using the prototype's sample data: a stationery brand offers ₹4,000 for one reel. Quoted prices the reel at ₹8,000 to 13,000, so ₹4,000 is on the table, and the opening ask is ₹12,000. If the deal settles at ₹9,500, nothing is left and ₹5,500 is recovered.

Leading indicators, with assumed targets: 70% of offers priced before the creator replies, 50% of under-range offers countered, 60% of closed deals logged with a final price, and a creator return of at least 3x the subscription. On the assumptions in section 7, a creator with 1.5 paid deals a month recovers about ₹1,100 a month: 1.5 deals × 60% under range × 50% countered successfully × a ₹2,500 average gap. Against a ₹399 subscription, break-even is one counter that lifts one deal by ₹399.

6. Go-to-market: start with a free price check

Quoted wins creators with a free price check that needs no sign-up, then converts the ones who keep getting offers.

Wedge. 'What should I charge for this reel?' works at the moment of need, when an offer sits unanswered in the DMs. The result is a shareable card (for example, 'my reel range: ₹8,000 to 13,000') that carries the product into stories and groups.

Channels, in order: creator educators who teach monetisation, who embed the checker for a revenue share; search and short video that answer 'how much to charge for a reel in India'; communities such as college creator clubs and Tier 2 to 4 city groups, where [Kofluence](#) says 43 to 48% of campaigns now run; and managers and small agencies, who buy a seat plan for 10 to 100 creators.

Pricing and unit economics (assumed). Free: 3 price checks a month. Pro: ₹399 a month for unlimited checks, reply drafts, the full board and the rate card page. Manager: ₹2,499 a month for 10 creators. With 8% of free users converting, 6% monthly churn and about ₹60 a month in AI cost, gross margin is about 85% and lifetime value about ₹5,650, against an acquisition budget of ₹1,000 or less per paid creator.

Alternative	What it gives	The gap Quoted fills
Kofluence and other brand-side platforms	Creator discovery and campaign tools for brands	No creator-side price check on the page reviewed
Billion Dollar Boy	A pricing tool trained on \$173M of past quotes and final deals	Serves its brand clients, not creators
Collabstr's calculator	An average rate for a platform, category and follower band, from 1.3m+ rates, in US dollars	Does not ask for views, usage rights or exclusivity, and has no counter or deal tracking

Phases. Each opens with a gate that tests an assumption: validate with 30 interviews and 50 hand-priced offers (weeks 1 to 4, A1); launch the free checker and Pro (months 2 to 4, A5); connect accounts, outreach and a manager pilot (months 5 to 8, A7); calibrate from closed deals (months 9 to 12, A4). The roadmap is drawn in the design pages.

7. Assumptions and risks: what could weaken this, and how we find out

Eight assumptions carry the case, and the numbers in sections 5 and 6 come from them. Each has a test and a line at which we change course.

Assumption	Test, and when we change course
A1. Creators feel pricing pain enough to pay. EY lists audience and credibility as their top challenges.	30 interviews and a 100-person waitlist. If under 25% would pay ₹399, reframe around outreach.
A2. A creator with 10,000 to 50,000 followers gets about 1.5 paid deals a month.	Ask at onboarding, then measure. If under 0.5, lead with the no-offers persona.
A3. 60% of first offers fall below a fair range, by about ₹2,500.	Log offer against range on the first 500 deals. If under 30%, reset the metric.
A4. The ₹250 to 900 per 1,000 views heuristic is a usable start. It is invented for this prototype.	Compare with final prices on the first 200 closed deals. Recalibrate when median error passes 30%.
A5. A counter backed by reach data moves brands: 50% of under-range offers reach the floor.	Log outcomes. If under 25% for two months, shift to outreach and the rate card.
A6. Typed-in stats can later be connected. Instagram insights exist only for professional accounts , and other people's accounts need Meta's Advanced Access.	Check how many pilot creators use professional accounts, and start Meta's app review in phase 1. If refused, add screenshot upload.
A7. ₹399 a month is acceptable, with 8% conversion and 6% churn.	Price tests at ₹299, ₹399 and ₹599. If conversion stays under 4%, weight manager plans.
A8. An AI check costs about ₹4.	Track from day one. If over ₹10, cap free checks and shorten prompts.

8. What is built, and where to find the rest

The prototype implements the full loop for Shalap's persona, with live AI wherever Claude is available.

- **Prototype:** [Quoted](#). Invite-only: sign in to Claude with the invited email, choose Open artifact, and allow the permission prompt when you press Price this deal. The AI runs on the viewer's own Claude account.
- **Screens built:** Home, Price a deal and Deals.
- **Part B, a separate file:** both prompts, 10 evals and 5 guardrails, each marked as enforced in code or by the prompt.
- **Design pages, a separate file:** journey maps for both personas, wireframes of the key screens and of what is not built (connected accounts, outreach, the rate card), the product loop, and the phase roadmap.
